## SIMPLE INTEREST

$I=$ Prt

- I is the amount of interest earned
- $\quad P$ is the principal sum of money earning the interest
- $r$ is the simple annual (or nominal) interest rate (usually expressed as a percentage)
- $\quad t$ is the interest period in years
$S=P+I$
$S=P(1+r t)$
- $\quad S$ is the future value (or maturity value). It is equal to the principal plus the interest earned.

## COMPOUND INTEREST

$\mathrm{FV}=\mathrm{PV}(1+i)^{\mathrm{n}}$
$\mathbf{i}=\frac{\mathbf{j}}{\mathbf{m}} \quad \mathbf{j}=$ nominal annual rate of interest
$\mathrm{m}=$ number of compounding periods
$\mathrm{i}=$ periodic rate of interest
$P V=F V(1+i)^{-n} \quad O R \quad P V=\frac{F V}{(1+i) n}$

## ANNUITIES

| Classifying rationale | Type of annuity |  |  |
| :--- | :--- | :--- | :---: |
| Length of conversion period <br> relative to the payment <br> period | Simple annuity - when the <br> interest compounding period is <br> the same as the payment period <br> $(\mathrm{C} / \mathrm{Y}=\mathrm{P} / \mathrm{Y})$. For example, a car <br> loan for which interest is <br> compounded monthly and <br> payments are made monthly. | General annuity - when the <br> interest compounding period <br> does NOT equal the payment <br> period (C/Y f P/Y). For <br> example, a mortgage for <br> which interest is compounded <br> semi-annually but payments <br> are made monthly. |  |
| Date of payment | Ordinary annuity - payments <br> are made at the END of each <br> payment period. For example, <br> OSAP loan payment. | Annuity due - payments are <br> made at the BEGINNING of <br> each payment period. For <br> example, lease rental <br> payments on real estate. |  |
| Payment schedule | Deferred annuity - first <br> payment is delayed for a period <br> of time. | Perpetuity - an annuity for <br> which payments continue <br> forever. (Note: payment <br> amount speriodic interest <br> earned) |  |

| Beginning date and end <br> date | Annuity certain - an annuity <br> with a fixed term; both the <br> beginning date and end date are <br> known. For example, installment <br> payments on a loan. | Contingent annuity - the <br> beginning date, the ending <br> date, or both are unknown. <br> For example, pension <br> payments. |
| :--- | :--- | :--- |

## ORDINARY SIMPLE annuity

$\mathrm{FV}_{\mathrm{n}}=\mathrm{PMT}\left[\frac{(1+i)^{\mathrm{n}}-1}{i}\right]$
Note: $\left[\frac{(1+i)^{\mathrm{n}}-1}{i}\right]$ is called the compounding or accumulation factor for annuities (or the accumulated value of one dollar per period).
$\mathrm{PV}_{\mathrm{n}}=\mathrm{PMT}\left[\frac{1-(1+i)^{-\mathrm{n}}}{i}\right]$

## ORDINARY GENERAL annuity

$$
\mathrm{FV}_{\mathrm{g}}=\mathrm{PMT}\left[\frac{(1+p)^{\mathrm{n}}-1}{p}\right] \quad \mathrm{PV}_{\mathrm{g}}=\mathrm{PMT}\left[\frac{1-(1+p)^{-\mathrm{n}}}{p}\right]
$$

***First, you must calculate $\boldsymbol{p}$ (equivalent rate of interest per payment period) using $p=(\mathbf{1 + i})^{\mathbf{c}} \mathbf{- 1}$ where $\boldsymbol{i}$ is the periodic rate of interest and $\mathbf{c}$ is the number of interest conversion periods per payment interval.
$c=\frac{\# \text { of interest conversion periods per year }}{\# \text { of payment periods per year }}$
$\mathrm{c}=\frac{\mathrm{C} / \mathrm{Y}}{\mathrm{P} / \mathrm{Y}}$

## CONSTANT GROWTH annuity

size of $n$th payment $=P M T(1+k)^{n-1}$
$\mathrm{k}=$ constant rate of growth
PMT = amount of payment
$\mathrm{n}=$ number of payments
sum of periodic constant growth payments $=$ PMT $\left[\frac{(1+k)^{\mathrm{n}}-\mathbf{1}}{k}\right]$
$\mathrm{FV}=\mathrm{PMT}\left[\frac{(1+i)^{\mathrm{n}}-(1+k)^{\mathrm{n}}}{i-k}\right]$
$\left[\frac{(1+i)^{\mathrm{n}}-(1+k)^{\mathrm{n}}}{i-k}\right]$ is the compounding factor for constant - growth annuities.
$\mathrm{PV}=\mathrm{PMT}\left[\frac{1-(1+k)^{\mathrm{n}}(1+i)^{-\mathrm{n}}}{i-k}\right]$
$\left[\frac{1-(1+k)^{\mathrm{n}}(1+i)^{-\mathrm{n}}}{i-k}\right]$ is the discount factor for constant - growth annuities.
$\mathbf{P V}=\mathbf{n}(\mathrm{PMT})(\mathbf{1}+\mathrm{i})^{-1}$ [This formula is used when the constant growth rate and the periodic interest rate are the same.]

## SIMPLE annuity DUE

$\mathrm{FV}_{\mathrm{n}}($ due $)=\operatorname{PMT}\left[\frac{(1+i)^{\mathrm{n}}-1}{i}\right](1+i)$
$\mathrm{PV}_{\mathrm{n}}($ due $)=\mathrm{PMT}\left[\frac{1-(1+i)^{-\mathrm{n}}}{i}\right](1+i)$

## GENERAL annuity DUE

$\mathrm{FV}_{\mathrm{g}}=\mathrm{PMT}\left[\frac{(1+p)^{\mathrm{n}}-1}{p}\right](1+i)$
$\mathrm{PV}_{\mathrm{g}}=\mathrm{PMT}\left[\frac{1-(1+p)^{-\mathrm{n}}}{p}\right](1+i)$
***Note that you must first calculate $\boldsymbol{p}$ (equivalent rate of interest per payment period) using $p=(1+i)^{c}-1$ where $\boldsymbol{i}$ is the periodic rate of interest and $\mathbf{c}$ is the number of interest conversion periods per payment interval.

## ORDINARY DEFERRED ANNUITIES or DEFERRED ANNUITIES DUE:

Use the same formulas as ordinary annuities (simple or general) OR annuities due (simple or general). Adjust for the period of deferment - period between "now" and the starting point of the term of the annuity.

## ORDINARY SIMPLE PERPETUITY

$\mathrm{PV}=\frac{P M T}{i}$

## ORDINARY GENERAL PERPETUITY

$\mathrm{PV}=\frac{P M T}{p} \quad$ where $p=(1+i)^{\mathrm{c}}-1$

## SIMPLE PERPETUITY DUE

$\mathrm{PV}($ due $)=\mathrm{PMT}+\frac{P M T}{i}$

## GENERAL PERPETUITY DUE

$\mathrm{PV}(\mathrm{due})=\mathrm{PMT}+\frac{P M T}{p} \quad$ where $p=(1+i)^{\mathrm{c}}-1$

## AMORTIZATION involving SIMPLE ANNUITIES:

Amortization refers to the method of repaying both the principal and the interest by a series of equal payments made at equal intervals of time.

If the payment interval and the interest conversion period are equal in length, the problem involves working with a simple annuity. Most often the payments are made at the end of a payment interval meaning that we are working with an ordinary simple annuity.

The following formulas apply:

$$
\mathrm{PV}_{\mathrm{n}}=\mathrm{PMT}\left[\frac{1-(1+i)^{-\mathrm{n}}}{i}\right] \quad \mathrm{FV}=\mathrm{PMT}\left[\frac{(1+i)^{\mathrm{n}}-1}{i}\right]
$$

## Finding the outstanding principal balance using the retrospective method:

## Outstanding balance $=$ FV of the original debt - FV of the payments made

Use FV = PV $(1+i)^{n}$ to calculate the FV of the original debt.
Use $\mathrm{FV} \mathrm{V}_{\mathrm{n}}=\mathrm{PMT}\left[\frac{(1+i)^{\mathrm{n}}-1}{i}\right]$ to calculate the FV of the payments made
